# CONSTRUCTION OF WOVEN REINFORCEMENTS

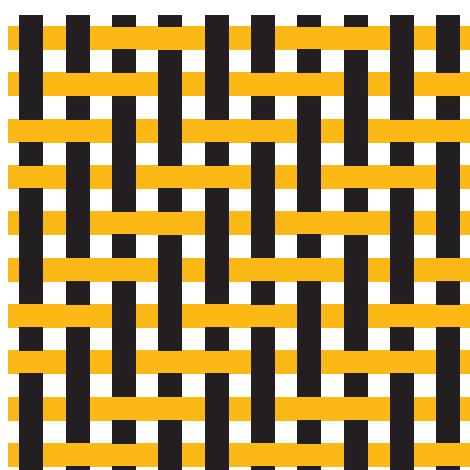

## Fabric construction ensures a variety of applications

Fabrics consist of two systems of parallel yarns, interlaced at ninety degrees to one another, the warp and the weft. Most fabrics have identical or similar numbers of threads in both directions and the yarn count is generally the same. These are known as bidirectional fabrics. The various weave patterns are created by sequentially raising different warp threads prior to inserting the weft.

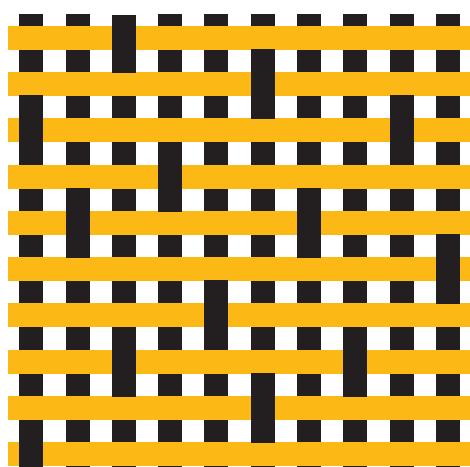

### PLAIN WEAVE

Basic weave pattern. The fabric is easy to handle due to good dimensional stability and minimal fraying when cut. Lends itself to large flat surfaces.

### TWILL WEAVE

Greater mechanical strength and stiffness of laminate due to limited thread deflection (crimp). The fabrics are more drapable and therefore better suited to shaped components than plain weave fabrics.

### SATIN WEAVE

Even less thread deflection than twill fabrics. Very good drapability makes it suitable for small radius shapes.

*Tailor-made fabrics constructions for special applications :*

### **UNIDIRECTIONAL FABRICS**

The thin weft threads are required solely to hold the warp threads in place. For the same amount of resin more warp threads can be brought into the laminate. This enhances the strength and stiffness of the laminate compared to bidirectional fabrics. These fabrics are used in applications with single axis loading.

### **MIXED FABRICS**

Different types of fibre are used in warp and weft. For example, a less expensive glass yarn can be used in the weft of a unidirectional carbon fabric, if the stiffness of the more expensive carbon fibre is not required in this direction.

### **HYBRID FABRICS**

Both the warp and the weft consist of more than one type. By combining various fibres it is possible to create a fabric exhibiting the best properties of each fibre, e.g. the impact resistance of aramid fibres with the rigidity of carbon fibres or the compressive strength of glass fibres.

# CONSTRUCTION OF MULTIAXIAL REINFORCEMENTS

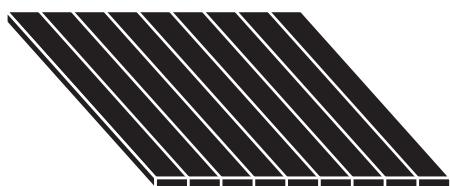

## Multiaxial reinforcements

are ideal textile structures for reinforced composites. Multiaxial fabrics are made from different number of layers, fibre orientation, type of fibre, weight of single layers. Their structure effectively allows to the manufacturer to process multiple layers of unidirectional fibres in single fabric. Single layers are fixed together by stitching with lightweight polyester yarn, bonding with PES scrim or resin compatible adhesive with structural layer of very light glass net. Multiaxial can be fixed on outer surface of the fabric or between its layers.

**Due to the fact that each layer is in different orientation or axis, they are called as multi-axial.**

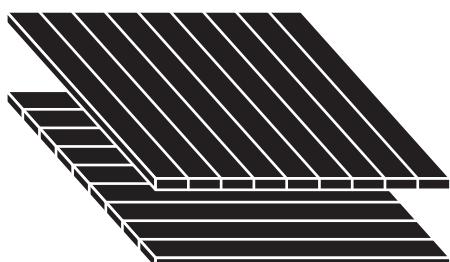

The most important advantages of multiaxial structures

- better mechanical properties (higher tensile and flexural properties) of the laminate
- optimized performance (reinforcing fibres in different axis)
- easier for handling (fixed layers with stitching or bonding)
- wide range of possible combinations, especially heavier materials
- reduced print-through
- uncrimped fibres allow good resin impregnation and flow which is optimal for infusion and RTM (stitching helps resin migration through layers and maximise infusion rates)

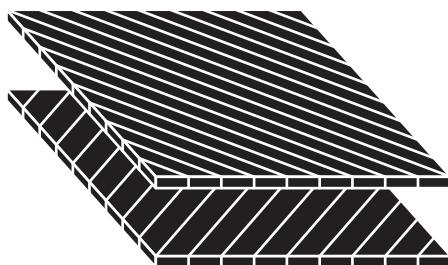

### UNIDIRECTIONALS (0°and 90°)

Suitable for applications requiring strength and/or stiffness in specific orientation of the laminate. Unidirectional fabric is characterized by high tensile strength which is advantage for GRP profiles only.

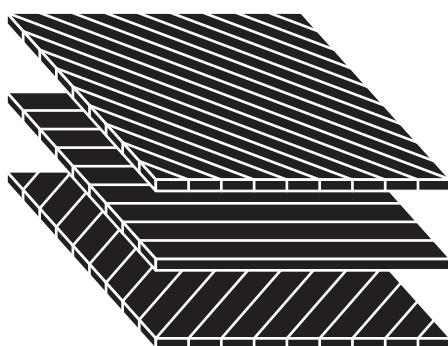

### BIAXIALS (0°/90°)

The application is similar to woven rovings. This structure offers improved laminate performance – increased tensile and structural strength, less weight and improved surface finish with less print-through.

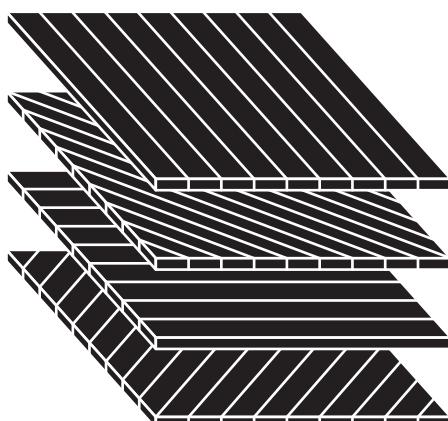

#### **BIAXIALS (+45°/-45°)**

This kind of biaxial fabric is used for applications where especially torsion strength and shear resistance is required. Excellent fibre coverage minimizes print-through.

#### **TRIAXIALS (0°/-45°/+45°) and (-45°/90°/+45°)**

Used in order to increase torsion rigidity in combination with longitudinal (0°/±45°) or transverse (-45°/90°/+45°) strength. Suitable for long and tubular structures such as rotor blades or gliders. Heavy fabrics reduce the number of needed layers.

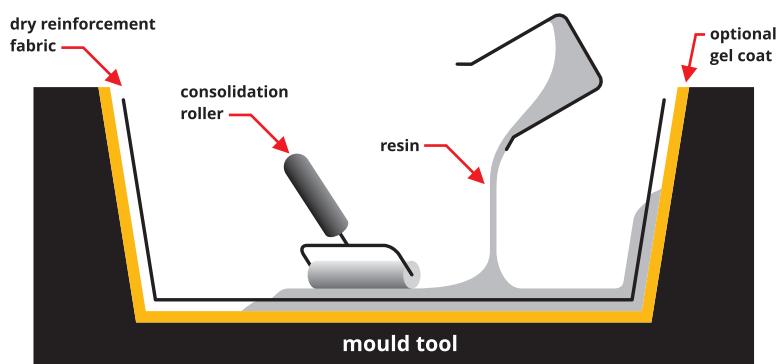

#### **QUADRIAXIALS (0°/-45°/90°/+45°)**

Quadriaxial structures offering strength in all four directions. They are excellent for production of boat hulls or pressure vessels (spread-pressure applications).

# LAMINATING TECHNOLOGIES

## Hand lamination

The most common application method for epoxy and polyester resins. This technology is used either for production of final products using a mould or production of moulds as such, respectively to make positive models. The method involves saturation of individual fabric layers with a resin (with a rolling pin or brush) and their sequential placing into a mould or on a surface of the required product. After the lamination work has finished, the mould gets cured as required, either at room temperature or at elevated temperature in an oven.

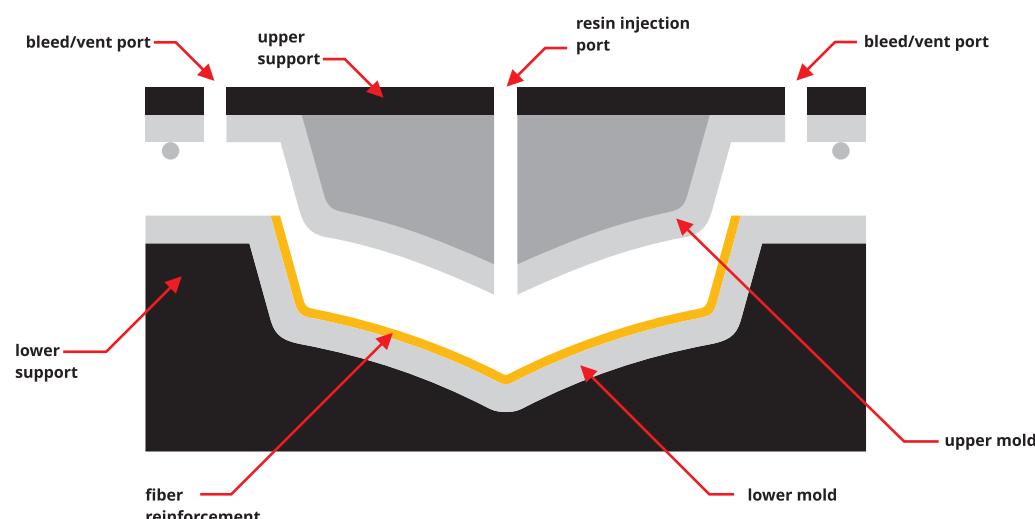

## Spray-up

This method is used mainly for application of gelcoats, topcoats and surface resins owing to its easy application and the ability to achieve homogenous surfaces.

## RTM (Resin Transfer Moulding)

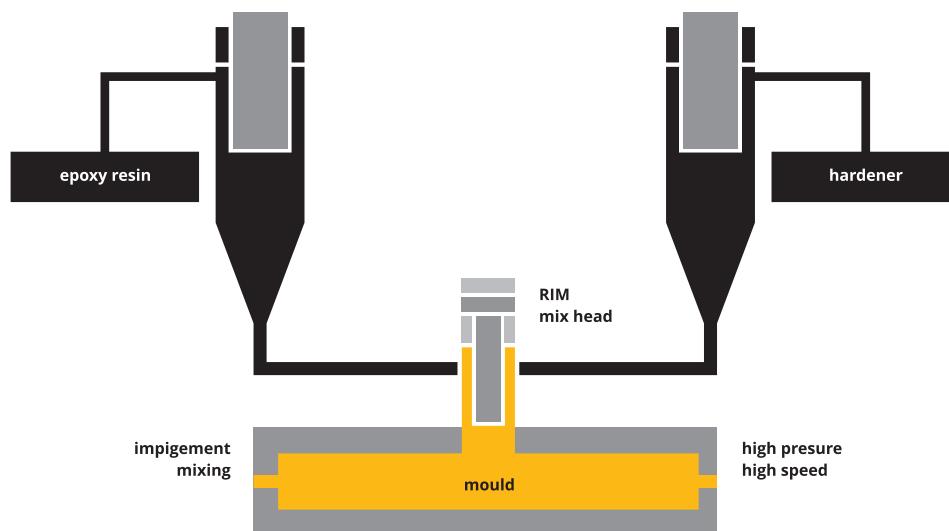

This method involves initial placing of prescribed composition of dry parts in a mould. Then vacuum is applied to the mould and through the vacuum the resin is sucked in by means of inlets and the product gets saturated. The moulds are one-sided moulds covered by foil so it is clearly visible when a complete saturation of the composite part has been completed. Afterwards the excess resin flows away through edge gouge. The inlet of resin is closed under constant vacuum. As a result, all the excess resin is sucked out and all the layers are pressed to create a compact unit. Very precise and identical parts can be manufactured using this method and the production takes relatively short period of time.

### RIM (Reaction Injection Moulding)

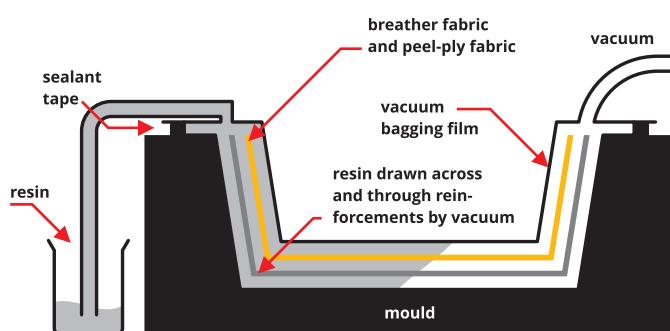

It is one of the most advanced machine productions of composite parts. In the initial stage, a mixture of A and B compound is mixed continuously by means of a dosing device. Afterwards, it is distributed under pressure (usually 2 – 10 bars) in a rigid two-part composite mould. From the opposite side of the mould, the resin can be sucked out with connected vacuum pump in order to simplify saturation of more complicated parts or to speed up the saturation process. This method is used mainly for serial production to achieve production of number of parts in the shortest possible period. The moulds are very often heated up or they are equipped with heating and cooling systems.

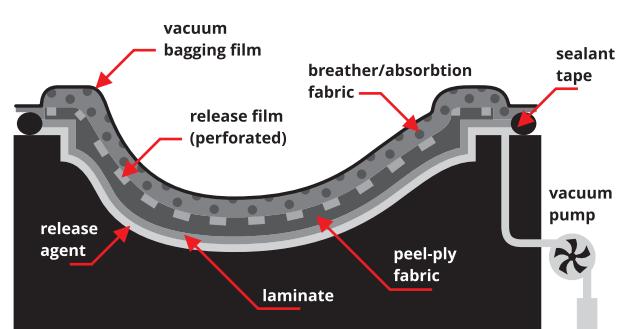

### Vacuum technology

Vacuuming belongs to more advanced technologies of hand lamination. After the product has been laminated in the mould, it is covered with a peel-ply, respectively also with a foil or breather fabric. Then air is sucked out of the product by means of vacuum. This makes individual layers cling firmly to each other without defect and the excess resin is sucked out of the product, which results in decreasing its weight and increasing the strength of the composite parts.

Vacuum infusion

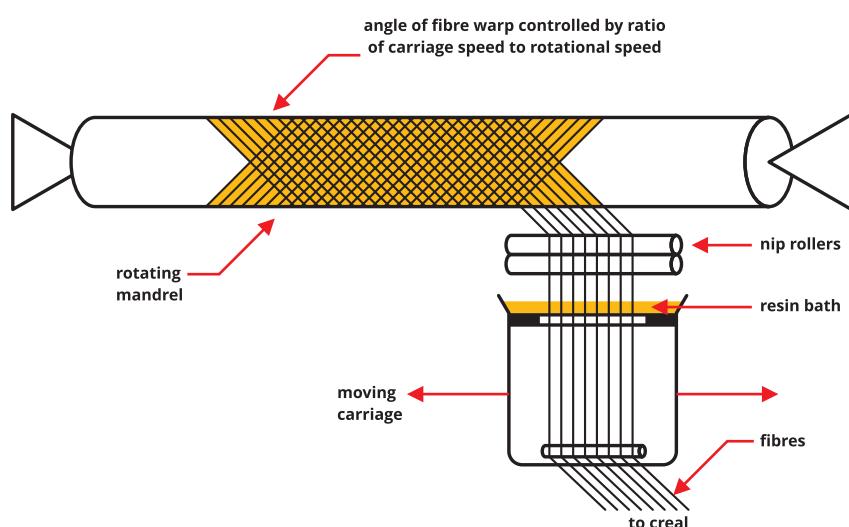

Hand lamination with subsequent vacuum technology

# LAMINATING TECHNOLOGIES

## Filament winding

Filament winding is a machine production involving continuous winding of roving in the machine, where (after the fiber has been saturated with resin) by means of a robotic arm moving in two or three spin axis, it is applied on a rotating mandrel. In this way tubes or various cone-shaped parts are manufactured. The advantage of this method is high product quality and option to adjust the percentage of the resin in the product as well as very precise distribution of individual fibers in the product. This gives a possibility to produce almost identical composite part that can be designed ahead using calculation or verified by breaking tests.

## Foaming

It involves two or three-component systems. Their task is usually to fill up larger hollow spaces inside composite parts or other parts so that unwanted substances are prevented from getting in those hollow spaces or the foaming systems are meant to fill up strained edges of laminates and create a compact sandwich structure. Their advantage is high adhesion to various materials and high strength with regard to low volume weight.

## Casting

Resin casting is a special application which involves either casting of various ready-made products from pure resin (without reinforcement) or various components covered by epoxy resins either for esthetical or protective reasons, e.g. to insulate conductive parts in electrical industry.

## Prepreg processing

It involves dry production using fabrics pre-impregnated with resin. This resin is partly cured (so called hot-melt prepreg) or uncured that needs to be protected with a foil so that the individual layers will not cling together. The required parts are then cut from these pre-impregnated fabrics and are then inserted in mould and cured by heat under pressure, alternatively under vacuum. Temperatures common for curing prepgres are in the range of 80°up to 140°C. The advantage of this method is a clean job, quick production speed (less manipulation involved) and accuracy of saturation as the percentage of resin saturation of prepreg is always known ahead. On the other hand, the disadvantage is inability to make optical surface and that is why prepgres are mainly used for technical parts or parts that need to be brushed and lacquered after demoulding.

## Bonding

By means of bonding composite parts can be attached to other parts or to each other in cases where a product cannot be produced as one-piece composite part. There are two types of bonding - structural bonding and non-structural bonding that is only to fix or attach a product. Structural joints are so strong that in most cases they can be compared with welded joint or they even outperform it.

# EPOXY

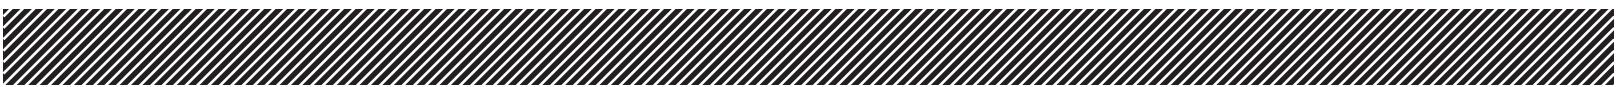

## Hi-tech laminating resins

Item	Characteristics / Application
Epoxy resin LG 120	low-viscosity standard laminating epoxy resin with excellent adhesion and very good heat resistance. Except hardener HG 353, heat postcuring is necessary.
Hardener HG 350, HG 351, HG 353	fast hardeners with short cure time even in thin layer and with lower exotherm. Mixing ratio 100 : 35, working time 10, 20 and 50 minutes.
<i>The industrial epoxy system for hand laminating.</i>	

Item	Characteristics / Application
Laminating resin LG 285	high quality epoxy resin designed for lamination without the need of heat postcuring. It has very good mechanical properties and sufficient elasticity even when heat postcuring is not applied. Designed for aviation industry.
Hardener HG 285, HG 286, HG 287	hardeners for epoxy resin LG 285, mixing ratio 100 : 40. Working time 45 minutes, 2 hours and 3 hours.
<i>Direct substitution of epoxy resin system L 285 by the former German company producer, which was used for aviation manufacturing. Certified comparative tests can be provided on request.</i>	

Item	Characteristics / Application
Epoxy resin EPIKOTE™ Resin MGS® LR 285	well-known epoxy resin.
Hardener EPIKURE™ Curing Agent MGS® LH 285, 286, 287	hardeners for EPIKOTE™ resin MGS® LR 285. Working time 45 minutes, 2 hours and 3 hours. Mixing ratio 100 : 40. Easily processable at room temperature.
Hardener EPIKURE™ Curing agent MGS® LH 133, 136, 137	range of hardeners for curing at room temperature. Mixing ratio 100 : 35.
Hardener EPIKURE™ Curing agent MGS® LH 500, LH 501	fast hardeners with short curing time even in thin layer. Mixing ratio 100 : 40, working time 25 and 50 minutes.

Item	Characteristics / Application
Epoxy resin LG 385	innovative epoxy resin L285 MGS. Thanks to new technology, this epoxy resin has higher temperature stability and advanced technical parameters. Heat postcuring is recommended for reaching maximum performance.
Hardener HG 385, HG 386, HG 387	hardeners for epoxy resin LG 385, processing possible from 18°C, mixing ratio 100 : 40. Meets sport aircraft standards after postcuring at temperatures of more than 56°C for 12 hours.
<i>The system is an industrial version of LG 285. Same mixing ratio, viscosity and gel time as for LG 285, heat postcuring is necessary.</i>	

## Hi-tech laminating resins

Item	Characteristics / Application
Epoxy resin LG 735 G	epoxy resin for 700 series, innovative non-toxic substitute of former toxic system Araldite® LY 5052. In contrary with Araldite LY 5052, it reaches up to 14% strength of carbon composites. High heat resistance (>100°C).
Hardener HG 735	hardener for epoxy resin LG 735 G, mixing ratio 100 : 35.
<i>This system is a non-allergic substitute of well-known nanofiber epoxy system Araldite LY 5052. In combination with carbon fiber, the system enables to reach up to 14% in strength.</i>	

Item	Characteristics / Application
Epoxy resin LG 700	new generation epoxy resin. Laminating system for RIM, RTM, vacuum technology and hand laminating. Extremely low viscosity enables processing of very light laminates. High reactivity. Working time from 25 minutes to 3 hours. Very good heat resistance and high flexibility even when postcured at room temperature.
Hardener HG 700 F, HG 700 R, HG 700 M+, HG 700 M, HG 700	working time 25, 30, 40, 50 and 70 minutes, mixing ratio 100 : 30.
Hardener HG 737	hardener for 700 series epoxy resins, mixing ratio 100 : 30, working time 2,5 to 3 hours. High flexibility, heat postcuring not necessary.
<i>This is a system for both RTM and hand lamination. It has a very low viscosity while maintaining good heat resistance and very flexible high strength bonds.</i>	

Item	Characteristics / Application
Epoxy resin LG 900 UV	high strength hybrid epoxy resin with content of nanoparticles. Developed for production of strongest composites, especially carbon ones. Compared to common epoxy resin systems it shows by 30% higher mechanical pressure parameters.
Hardener HG 100	Hi-tech laminating hardener with long working time (approx. 3 hours). One of the best hardeners with excellent mechanical parameters after curing on the market. Heat postcuring is necessary.
Hardener HG 120	mixing ratio 100 : 25, heat resistance after postcuring at 90°C is 120°C. Heat postcuring is necessary.
<i>The best epoxy-amine hybrid system for production of composites. Long pot-life for comfortable production of also large parts. High UV and weather conditions resistance, especially with hardener HG 120. HTD higher than 90°C.</i>	

Item	Characteristics / Application
Epoxy resin LG 206	low-viscosity standard laminating epoxy resin with excellent mechanical parameters, designed for lamination without the need of heat postcuring.
Hardener HG 358	very slow hardener with long working time (approx. 4 - 5 hours). Mixing ratio 100 : 34.
Hardener HG 359	hi-tech laminating hardener that has got very long working time (over 6 hours) and reaches the basic strength even at room temperature (within 24 hours).
<i>The epoxy-amine hybrid system for production of composites. Very long pot-life for comfortable production of also large parts. It can be used for production of both extremely large and also very precise parts, especially with hardener HG 359. Tg of the system is 85°C.</i>	

# EPOXY

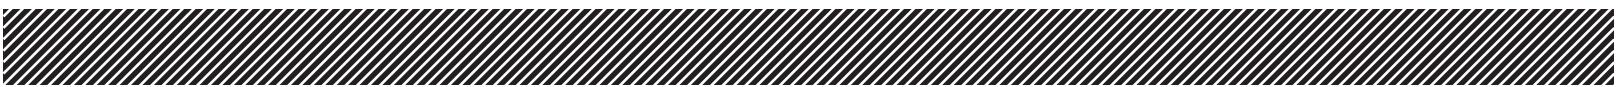

## Hi-tech laminating resins

Item	Characteristics / Application
Epoxy resin LG 120	low-viscosity standard laminating epoxy resin with excellent adhesion and very good heat resistance.
Hardener HG 100	Hi-tech laminating hardener with long working time (approx. 3 hours). One of the best hardeners with excellent mechanical parameters after curing on the market. Heat postcuring is necessary.
Hardener HG 120	mixing ratio 100 : 25, heat resistance after postcuring at 90°C is 120°C. Heat postcuring is necessary.
<i>Hi-tech system with very high Tg. It can be used for winding of carbon fiber filament roving (e.g. Masts, spindles and wind turbine blade connections).</i>	

Item	Characteristics / Application
Epoxy resin LG 115	the most commonly used standard laminating epoxy resin. Suitable for both laminating and mould processing. Heat postcuring is recommended.
Epoxy resin LG 730	new generation, very runny, liquid type epoxy resin. Very good strength even at room temperature without the risk of stiffness. High reactivity and heat resistance.
Epoxy resin LG 815	tough laminating epoxy resin for processing of abrasion and crush resistant components. Suitable for laminating of wild-water kayaks.
Hardener HG 25, HG 25 M	hardeners with favourable working time 25 minutes and 35 - 40 minutes. Mixing ratio 100 : 25, postcuring at minimum 50°C is necessary.
Hardener HG 28	two-hour hardener for epoxy resin LG 730, suitable for mechanically stressed components (e.g. airscrew spinners). Mixing ratio 100 : 30.

## Laminating epoxy systems for production of moulds

Item	Characteristics / Application
Epoxy resin LG 112	epoxy resin of very good strength, shape stability and very good temperature stability (up to 140°C). Used for processing of high quality moulds. Heat postcuring is necessary.
Hardener HG 2	hardener suitable especially for epoxy resin LG 112. Very good strength and shape stability at high temperatures (approx. 120°C). Mixing ratio 100 : 30. Heat postcuring is necessary for reaching declared parameters.
Hardener HG 40 F, HG 40 M and HG 40	range of hardeners for mould epoxy resins. Mixing ratio 100 : 40, working time 25 minutes, 40 minutes and 1 hour. Heat postcuring for reaching maximum performance.
Hardener HG 120	mixing ratio 100 : 25, heat resistance with epoxy resin LG 112 up to 150°C. Heat postcuring is necessary.
<i>This is a system especially designed for mould production. It has very high shape stability, solidity and heat resistance.</i>	

## Laminating epoxy-anhydride systems

Item	Characteristics / Application
Epoxy resin LG 150	flexible variety of epoxy resin for anhydride systems with Tg up to 100°C. Suitable for prepgs and filament winding.
Hardener VE 95	anhydride hardener for epoxy resins. Curing from 80°C.
Hardener VE 95-2	anhydride hardener for epoxy resins. Curing from 80°C. Variety with accelerator.
Hardener VE 112	anhydride hardener for epoxy resins. Designed for epoxy resin LG 150 for winding of high pressure carbon vessels.
Hardener VE 112-2	anhydride hardener for epoxy resins. Designed for epoxy resin LG 150 for winding of high pressure carbon vessels. Variety with accelerator.
Accelerator SG 2	standard accelerator for anhydride epoxy systems.

*This is a very quick anhydride system that enables post cure at lower temperatures (85°C). It is suitable for winding of pressure vessels.*

Item	Characteristics / Application
Laminating epoxy resin LG 100	component of slow anhydride system with high Tg (> 120°). Suitable for prepgs and filament winding.
Hardener VE 100	non-accelerated hardener for anhydride system LG 100 + VE 100.
Hardener VE 100-2	hardener for anhydride system LG 100 + hardener VE 100, with 2% of accelerator SG 2 for other than three-component dosing and blending systems.
Accelerator SG 2	standard accelerator for anhydride epoxy systems.

*This system is a very slow anhydride system for prepreg manufacturing and winding. The manufacturing equipment can be cleaned even after several days. The system has high Tg. Post cure at higher temperature is needed.*

## Foaming and casting epoxy systems

Item	Characteristics / Application
Epoxy resin LG 100	foaming epoxy system with high toughness and adhesion. Heat resistance after postcuring exceeds 80°C.
Hardener HG 30	hardener for epoxy foam system. Mixing ratio 100 : 30 (hard brittle foam) to 100 : 40 (tough foam).
Blowing agent FC 3	blowing agent. Dosage according to required foam density 1 - 5%. At 3% cca. 5 times foaming.
<i>This is a flexible foam system with very high strength. It creates even thick non-fragile foam with density of 120 - 300 kg/m³</i>	

# EPOXY

## Foaming and casting epoxy systems

Item	Characteristics / Application
Epoxy resin SLIP LG 100	highly transparent epoxy resin enabling thick multiple layer casting. Suitable especially for special applications such as promotion gifts, glass and ice imitations. Skin sensitive.
Hardener S - HG 130	mixing ratio 100 : 30. Very slow hardener almost free of exotherm, very good parameters even at room temperature.
Hardener S - HG 140	mixing ratio 100 : 40. Approximately by 40% faster than hardener S-HG 130. Contains compounds that gives bright shine even to surfaces stuck to the mould. Slightly higher exotherm than hardener S-HG 130.

## Epoxy gelcoats

Item	Characteristics / Application
Epoxy resin LG C1	transparent, chemically resistant epoxy gelcoat. Used for coating of epoxy-laminated fuel tanks or for other transparent protection layers.
Hardener HG C1	hardener for epoxy gelcoat LG C1. Mixing ratio 100 : 50, working time approx. 50 minutes.
<i>This is a chemical resistant epoxy gelcoat. It is resistant to all dissolving agents including petrol after it has been tempered. It can be used as topcoat.</i>	

Item	Characteristics / Application
Epoxy gelcoat FG 110	NOVOLAC based epoxy gelcoat, beige colour.
Hardener FT 110	hardener for epoxy gelcoat FG 110, mixing ratio 100 : 10.
Hardener FT 113	hardener for epoxy gelcoat FG 110, mixing ratio 100 : 13.
<i>This is a nanofiber mould gelcoat of a very high hardness (95 Shore D) that enables intensive sanding and polishing. It is not fragile.</i>	

Item	Characteristics / Application
Epoxy gelcoat G 70 UV	extremely UV stable epoxy gelcoat, transparent.
Hardener GT 70	slow hardener for gelcoat G 70 UV, mixing ratio 100 : 25.
Hardener HG 700 R	superb water clear variation, hardener for gelcoat G 70 UV, working time approx. 1 hour, mixing ratio 100 : 25.
Hardener HG 133	the most commonly used fast hardener for gelcoat G 70 UV, working time approx. 20 minutes, mixing ratio 100 : 30.
<i>This is UV stable epoxy gelcoat which is resistant to all weather conditions, UV rays and chemicals.</i>	

## Epoxy gelcoats

Item	Characteristics / Application
Epoxy gelcoat RenGel® SW 56	time proven gelcoat for moulds. Very good grinding and polishing properties.
Epoxy gelcoat RenGel® SW 18	green epoxy gelcoat for moulds with very good polishing properties and heat resistance.
Epoxy gelcoat RenGel® SW 404	highly resistant epoxy gelcoat for edges and also whole moulds. Polishing is not possible.
Hardener Ren® HY 5159	hardener for epoxy gelcoats RenGel® with very good heat resistance. Heat postcuring is necessary.
Hardener Ren® HY 2404	hardener for epoxy gelcoats RenGel® used for cases where postcuring by heat is not possible.

## Epoxy adhesives

Item	Characteristics / Application
Epoxy glue FIX BOND 57 - compound A	special high bond glue with very high peeling strength and bond flexibility. Glued bonds to metal have higher strength than welded joints. Hard, stable bonds from -60°C to 100°C.
Epoxy glue FIX BOND 57 - compound B	hardener for epoxy glue FIX BOND 57 A, mixing ratio 100 : 140
Epoxy glue FIX BOND 57 TIX - compound A	black, completely tixotropic variety of structural adhesive FIX BOND 57.
Epoxy glue FIX BOND 57 TIX - compound B	hardener for epoxy glue FIX BOND 57 TIX A, mixing ratio 100 : 130.
Epoxy glue FIX BOND 150 - compound A	flexible glue suitable especially for sticking of wooden cores with glass or fiberglass under pressure and heat (skateboards, snowboards, skis, etc.)
Epoxy glue FIX BOND 150 - compound B	hardener for epoxy glue FIX BOND 150 A. Working time approx. 35 minutes. Commonly used under pressure and high temperature 90 - 120°C for several minutes.
5 minute epoxy glue - compound A	very quick epoxy glue suitable for all applications with very short gel time or where tempering is not possible. It is suitable for fixing of individual elements together.
5 minute epoxy glue - compound B	hardener for 5 minute Epoxy glue A, mixing ratio 100 : 100.
Epoxy glue FLEX 40 - compound A	all-purpose glue for metal components, cured laminates and wood. High viscosity, working time approx. 50 minutes. Postcuring at minimum 70°C is recommended.
Epoxy glue FLEX 40 - compound B	hardener for epoxy glue FLEX 40 A, mixing ratio 100 : 40.

## POLYESTER AND VINYLESTER

### Polyester resins for laminating and moulds production

Item	Characteristics / Application
Polyester resin H-834 REA 30	medium reactive, thixotropic, pre-promoted resin designed for use in manufacturing of boats and other composite parts using hand lay-up or spray-up applications method. Processability of 30 minutes.
Polyester resin RM 2000	unsaturated polyester resin made especially for mould production. Suitable for production of more complicated moulds and also for those of difficult shapes. Processability of 40 - 45 minutes.
Polyester resin RM 2000 LGT	unsaturated polyester resin made especially for mould production. Suitable for production of more complicated moulds and also for those of difficult shapes. Processability of 60 - 70 minutes.
Peroxide CATA 2000	peroxide for resins RM 2000, mixing ratio 100 : 1 - 1,5
Peroxide K1	peroxide for curing of polyester resins, mixing ratio 100 : 1 - 3
Peroxide Butanox M 50	peroxide for curing of polyester resins, mixing ratio 100 : 1,5

### Polyester gelcoats, hardeners and thinners

Item	Characteristics / Application
Polyester gelcoat EC G30	transparent polyester gelcoat compatible with epoxy laminates
Polyester gelcoat EC G35	white polyester gelcoat compatible with epoxy laminates
Polyester gelcoat EPIKOTE™ Resin MGS GR T30F	transparent polyester gelcoat compatible with epoxy laminates
Polyester gelcoat EPIKOTE™ Resin MGS GR T35	white polyester gelcoat compatible with epoxy laminates
Polyester gelcoat EPIKOTE™ Resin MGS GR T35SH	white polyester gelcoat compatible with epoxy laminates, variety for spraying ultralight airplanes and gliders.
Hardener EPIKURE™ Curing Agent MGS GH SF2	hardener for polyester gelcoats MGS®, mixing ratio 100 : 1,5 - 2
Hardener EPIKURE™ Curing Agent MGS GH SF10	hardener for polyester gelcoats MGS®, mixing ratio 100 : 10
Thinner HELOXY™ Additive MGS V VSF	thinner for unsaturated polyester resins and gelcoats MGS®. Contrary to acetone, it is more gentle to the cleaned material.
Polyester gelcoat Polygel 3232	highly transparent polyester acrylate topcoat with high UV stability grade. UV cureable.
UV initiator	hardener for polyester resin Polygel 3232, curing initiated by UV lamp or sunlight. Curing time 2 - 15 minutes.
Thinner for Polygel 3232	reactive thinner for Polygel 3232, fully UV cureable. It is embedded into the structure and improves strength of coating.

### Vinylester laminating resins

Item	Characteristics / Application
Vinylester resin 680 TPA	vinylester tixotropic accelerated resin for production of chemical resistant products, suitable for hand laminating, spraying and RTM application.

## AUXILIARY MATERIALS, ACCESSORIES AND TOOLS

### Release agents, fillers and pigment pastes

Item	Characteristics / Application
Release agent PVA All-purpose, transparent	barrier release agent based on polyvinylalcohol. Can be applied both by brushing and spraying. It creates perfectly adhesive and glossy surfaces.
Release agent PVA All-purpose, coloured	coloured variation of PVA release agent that enables optical control over compactness of PVA film after its application on the mould.
Release agent PVA MAX	barrier release agent based on polyvinylalcohol with increased release effect. 100 % guarantee of release.
TR 905 - Mould cleaner	cleaning agent for mould surfaces. It eliminates surface defects and release agent residues.
TR 910 - Liquid Semi-permanent sealer	liquid sealer for mould surface preparation. The sealer needs to be used for new moulds, older moulds with micro-porosity and other minor surface defects. It is used prior to application of release agents TR-900 series.
TR 930 - Semi-permanent release agent	reliable all-purpose release agent, gets dry quickly at room temperatures, for quick application.
Trennmittel WX-3070 - spray (400 ml)	release agent in spray based on wax, reliable for technical release.
Trennmittel WX-3070 - concentrate	variety of release agent based on wax without spray.
Trennspray W-27 (400 ml)	release agent in spray based on wax, reliable for technical release.
Mould Release Paste Wax Oskar's M-700/C	solid emulsion of pure carnaube wax and carbon dissolving agents, it creates very hard, resistant and glossy layer. Does not contain silicones. Does not create optical "eyes" when gelcoat is applied with a spray.
Buffing- and Polishing Compound Oskar's M-50	efficient polishing and brushing paste for gloss restoration of dull moulds or for polishing of new moulds. Does not contain wax or silicon.
Buffing- and Polishing Compound Oskar's M-100	standard polishing paste for polishing polyester or epoxy laminate surfaces.
Super finish Polishing Compound Oskar's M-150	standard polishing paste for polishing polyester or epoxy laminate surfaces.
Maximum Mold Release Wax Meguiar's M-8	release wax enabling maximum number of releases for one application. Suitable mainly for new moulds and tools. The best option to ensure maximum release properties.
Professional Paste Wax Meguiar's M-16	traditional wax paste providing excellent protection mainly at extreme conditions, quick-dry variety of original formula, does not get white during drying, suitable for all surfaces.

## AUXILIARY MATERIALS, ACCESSORIES AND TOOLS

### Release agents, fillers and pigment pastes

Item	Characteristics / Application
High Temp Mold Release Wax Meguiar's M-87	release wax destined for high temperatures, its composition enables reaching maximum results during production of moulds at high temperatures.
Universal Mold Release Wax Meguiar's M-88	extremely resistant release wax creating highly glossy surface destined for all-purpose applications, mainly for new and tempered moulds.
TR 104 High Temperature Wax	ideal for temperatures of up to 120°C, a high production paste release with excellent breakdown for fast even coverage. Formulated for fast drying with pure carnauba base. Extremely easy to apply and wipe.
Release wax W-27	release agent to be used for all-purpose applications, matt surface.
RenLease® QV 5110	cloth applied way based release agent for general applications. Polishable to lustre.
RenLease® QZ 5111	a liquid suspension of waxes in solvent for the release of general and intricate mould surfaces. Polishable to lustre.
Priming wax	highly efficient priming wax for base surfaces with low wetting properties, silicone-free, resistant up to ca. 100°C.
Partall® Hi-Temp Wax	high-temperature release wax for high-gloss surfaces, silicone-free. Ideal for smooth, tight surfaces.
Partall® paste #2	release wax for epox, polyester and vinylester resins, silicone-free, useable up to 60°C. For high-gloss surfaces.
Microspheres Q-CELL 7014/7019	suitable for thickening of all epoxy resins. Microballoons are small, hollow, glass spheres that thicken the epoxy resin and reduce the weight of the system.
Microspheres BJO-0930 phenolic	self-extinguishing variety of microballoons made of phenolic resin. Ideal for mixing with epoxy matrix. Designed for aviation industry.
Microspheres Expance 461 DET 40 d25	dry, expanded microspheres. Used as a light wight filler of epoxy resins and polyester putties. Offers high resiliency and easy compression.
AEROSIL® 200	thixotropic agent. Hydrophilic silica suitable for building up all epoxy resins. Used for vertical applications to prevent drain-out. Even small amount of the powder results in thixotropic properties.
HL® 200	thixotropic agent. Hydrophilic silica suitable for building up all epoxy resins. Used for vertical applications to prevent drain-out. Even small amount of the powder results in thixotropic properties. Economic option to AEROSIL® 200.
Cotton flocks	milled cotton fiber used for thickening of epoxy resins that have to keep very good construction strength.
Chopped glass strand	loose binding agent for thickening of resins or putty. Available as 0,2 mm, 3 mm, 4 mm and 6 mm long strands.
Chopped carbon strand	filler suitable for ensuring conduction of electrical static charge away, improves mechanical parameters of laminate. Available as 0,2 mm, 1 mm, 3 mm and 6 mm long strands.

## Release agents, fillers and pigment pastes

Item	Characteristics / Application
Microcellulose powder	suitable for thickening of all resins. It is used for applications where resin needs to hold in vertical position and prevent from flowing down.
Aluminium granulate, particle size 200 µm	filler suitable for increasing of heat conduction of moulds. Available as granules (particles of size under 200 µm) or pellets (fraction of 0,5 - 1,6 mm, 0,2 - 0,5 mm).
Universal pigment pastes	colour shades according to RAL colour scale, all-purpose pastes suitable both for epoxy and polyester resins.

## Shears and cutters

Item	Characteristics / Application
Scissors ROBUSTO 405/C/6"	straight scissors with micro-serration and polyurethane coated handles, suitable for cutting technical textiles. Total length 16 cm.
Scissors ROBUSTO 405/2/C/6"	scissors with bent-up blades and micro-serration, polyurethane coated handles, suitable for cutting technical textiles. Total length 16 cm.
Scissors ROBUSTO 405/2/B-CR/6"	steel mould-making scissors with bent-up blades and micro-serration. Total length 16 cm.
Scissors ROBUSTO 1020/HQ/C/7	straight steel shears, handles with black lacquer finish. Total length 18,5 cm.
Scissors ROBUSTO 1020/HQ/C/8"	straight steel shears, handles with black lacquer finish. Total length 21 cm.
Scissors ROBUSTO 1020/HQ/C/9"	straight steel shears, handles with black lacquer finish. Total length 23,5 cm.
Scissors ROBUSTO 1020/HQ/C/10"	straight steel shears, handles with black lacquer finish. Total length 26 cm.
Scissors ROBUSTO 1020/HQ/C/11"	straight steel shears, handles with black lacquer finish. Total length 29 cm.

## AUXILIARY MATERIALS, ACCESSORIES AND TOOLS

### Shears and cutters

Item	Characteristics / Application
Scissors ROBUSTO 1024/C/10"	straight steel shears with micro-serration and polyurethane coated handles, suitable for cutting technical textiles. Total length 26 cm.
Scissors ROBUSTO 1026/C/8"	straight steel shears with micro-serration and polyurethane coated handles, suitable for cutting technical textiles. Total length 21 cm.
Scissors ROBUSTO 1026/B-CR/9,5"	completely chrome-plated narrow shears, with micro-serration, suitable for laminate fabrics. Total length 25 cm.
Scissors ROBUSTO 1026/2/B-CR/8"	completely chrome-plated shears with bent-up blades and micro-serration, suitable for laminate fabrics. Total length 21 cm.
Scissors ROBUSTO 1040/C/10"	narrow shears for left-handers, handles with polyurethane coating. Total length 26 cm.
Scissors ROBUSTO 540426-10"	narrow shears for left-handers, handles with black lacquer finish. Available also with micro-serration. Total length 26 cm.
Scissors ROBUSTO 1053/CR/10"	straight chrome plated shears with comfort handles, extreme easy for handling and control, suitable for cutting technical textiles. Total length 26 cm.
Scissors ROBUSTO 1071/C/7,75"	straight shears with short lades and long handles for short-length cuts, with micro-serration, suitable for technical textiles. Total length 20 cm.
Scissors ROBUSTO 1249/4/E/6"	mould-making scissors with bent-up blades and offset handles, completely nickel-plated. One blade micro-serrated. Total length 16 cm.

ROBUSTO scissors mould making series

ROBUSTO scissors with polyethylene handles

## Shears and cutters

Item	Characteristics / Application
Scissors ROBUSO 1253/4/B-CR/7"	mould-making scissors with bent-up blades and offset handles, one blade micro-serrated. Suitable for laminate fabrics. Total length 18,5 cm.
Scissors ROBUSO 2010/R/8"	light shears with stainless blades and unbreakable black plastic handles. Total length 21 cm.
Scissors TECX 2042/R/10"	high quality shears with large unbreakable plastic handles. Suitable also for left-handers. Total length 26 cm.
Rotary cutter KAI Ø 28 mm	small rotary cutter
Replacement blades for rotary cutter Ø 28 mm	replacement rotary blade, 2 blades per package
Rotary cutter OLFA Ø 45 mm	medium rotary cutter
Replacement blades for rotary cutter Ø 45 mm	replacement rotary blade, 1 blade per package
Rotary cutter OLFA Ø 60 mm	large rotary cutter
Replacement blades for rotary cutter Ø 60 mm	replacement rotary blade, 1 blade per package
EC Cutter Set - serrated	electric shears designed for cutting of Kevlar®, Twaron®, Dyneema®, glass and carbon fiber materials. Mains- and battery-powered operation for unrestricted choice of working environment.
Replacement cutter head for EC-Cutter	replacement cutter head, unserrated
Replacement cutter head for EC-Cutter - with micro-serration	replacement cutter head, serrated
Heavy duty cutter OLFA with rubber grip, small	heavy duty cutter with rubber grip and automatic blade lock
Heavy duty cutter OLFA with rubber grip, large	heavy duty cutter with rubber grip, automatic blade lock and built-in hard metal pick for multipurpose applications.

Heavy duty cutter OLFA with rubber grip, small

Heavy duty cutter OLFA with rubber grip, large

## AUXILIARY MATERIALS, ACCESSORIES AND TOOLS

### Vacuum bagging films, perforated release films and sealant tapes

Item	Characteristics / Application
Bagging film FLM120	a light green, vacuum bagging film. Maximum use temperature 120°C, thickness 0,075 mm, elongation 330%.
Bagging film TBL170	a pink, vacuum bagging film (tube). Maximum use temperature 170°C, thickness 0,050 mm / 0,075 mm, elongation 410%.
Bagging film TBL200	a green, vacuum bagging film (tube). Maximum use temperature 195°C, thickness 0,050 mm, elongation 330%.
Bagging film PO120	a green, vacuum bagging film. Maximum use temperature 120°C, thickness 0,075 mm / 0,08 mm, elongation 400%.
Bagging film PO180	a pink, vacuum bagging film. Maximum use temperature 180°C, thickness from 0,05 to 0,075 mm, elongation 360%.
Bagging film PO180 TUBE	a pink, vacuum bagging film (tube). Maximum use temperature 180°C, thickness from 0,05 to 0,075 mm, elongation 360%.
Bagging film PO150 XD2	a transparent, extremely flexible vacuum bagging film. Maximum use temperature 145°C, thickness 0,08 mm, elongation 1000%.
Bagging film PA205	a transparent, vacuum bagging film. Maximum use temperature 205°C, thickness 0,05 / 0,075 mm.
Release film FLD 120 HD	release film, blue colour, perforation P3/P31/N. Maximum use temperature 120°C, thickness 0,025 mm, elongation 200%.
Release film FLD 150 HD	release film, yellow colour, perforation P3/P31/N. Maximum use temperature 153°C, thickness 0,030 mm, elongation 400%.
Release film FLD 170 HD	release film, green colour, perforation P3/P31/N. Maximum use temperature 168°C, thickness 0,030 mm, elongation 400%.
Release film HT 500	release film, red colour. Maximum use temperature 200°C, thickness 0,013 or 0,025 mm, elongation 150%.
Perforated release film ELA20	perforated release film, blue colour, perforation P1/P3/N. Maximum use temperature 125°C, thickness 0,025 mm, elongation 300%.
Perforated release film PP40	polypropylene perforated release film, red colour, perforation P1/P3/N. Maximum use temperature 160°C, thickness 0,04 mm, elongation 700%.
Perforated release film ETFE230	perforated release film, blue colour, perforation P1/P3/N. Maximum use temperature 230°C, thickness 0,013 / 0,02 mm, elongation 300%.
Perforated release film PMP200	perforated release film, purple colour, perforation P1/P3/N. Maximum use temperature 200°C, thickness 0,03 mm, elongation 330%.
Sealant tape LSM6000 - 3 x 13 mm	low temperature sealant tape for temperatures up to 90°C, brown colour, roll length 13 m.
Sealant tape LSM1310 - 2,5 x 12 mm	medium temperature, hyper tack sealant tape for temperatures up to 110°C, black colour, roll length 15 m.
Sealant tape LSM5200 - 2,5 x 12 mm	medium temperature, hyper tack sealant tape for temperatures up to 140°C, black colour, roll length 15 m. Economic option.
Sealant tape AN-3 12 x 2 mm (or 6 x 2 mm)	universal sealant tape for temperatures up to 150°C, grey colour, roll length 21 m.
Sealant tape AN-3 HT 10 x 3 mm (or 6 x 2 mm)	high-temperature sealant tape for temperatures up to 210°C, yellow colour, roll length 14 m.

P1 = perforated P1 (punched holes, Ø 1,0 mm), P3 = perforated P3 (hot perforation, Ø 0,38 mm), P31 = perforated P31 (hot perforation, Ø 0,6 mm), N = non-perforated

## Vacuum bagging films, perforated release films and sealant tapes

Item	Characteristics / Application
Sealant tape LSM7000 - 3 x 12 mm	high temperature sealant tape for temperatures up to 210°C, yellow colour, roll length 12,5 m.
Sealant tape LSM3000 FLEX - 50 x 1,5 mm (FOR DIADRRAIN MP APPLICATION)	low temperature sealant tape for temperatures up to 90°C, black colour, roll length 25 m.
Vacuum bag sealant (putty)	rubber for vacuum bagging, used in the construction of sealings

P1 = perforated P1 (large), P3 = perforated P3 (small), N = non-perforated

## Carbon rods and tubes

Item	Length
Carbon rods Ø 2 mm	1250 mm
Carbon rods Ø 5 mm	2000 mm
Carbon rods Ø 6 mm	2000 mm
Carbon rods Ø 13 mm	1960 mm
Carbon rods Ø 14 mm	2000 mm
Carbon tubes 3,0 x 1,9 mm	1250 mm
Carbon tubes 4,0 x 2,5 mm	1250 mm
Carbon tubes 5,0 x 3,0 mm	2000 mm
Carbon tubes 5,0 x 3,5 mm	2000 mm
Carbon tubes 6,0 x 4,0 mm	2000 mm
Carbon tubes 8,0 x 6,0 mm	2000 mm

## Manipulation and handling

Item	Characteristics / Application
Plastic barrel cock 3/4"	small polyethylene drain barrel cock
Plastic barrel cock 2"	large polyethylene drain barrel cock
Catalyst dispenser CD 15	calibration 15 ml, reservoir 500 ml. Liquid dispenser moulded from a durable, high grade flexible polypropylene. Ideal for use with difficult fluids where cleaning would be unacceptable. Cost effectively disposable due to the inexpensive construction.
Catalyst dispenser CD 80	calibration 80 ml, reservoir 1000 ml. Liquid dispenser moulded from a durable, high grade flexible polypropylene. Ideal for use with difficult fluids where cleaning would be unacceptable. Cost effectively disposable due to the inexpensive construction.
Hand truck for drum transportation	truck with support wheel for transportation and manipulation with drums. When lying in vertical position the drum can rotate and its contents can be emptied. Maximum load 300 kg
Sack truck for drum transportation	sack truck with support wheel for transportation of empty or filled drums. Maximum load 250 kg.

## AUXILIARY MATERIALS, ACCESSORIES AND TOOLS

### Infusion and vacuum moulding accessories & tubes

Item	Characteristics / Application
Transparent PE-LD hose 10 x 12,5 mm	LD polyethylene pipe for vacuum and resin flow, roll length 50 m.
ECO SILICONE HOSE 10 x 18 mm	reinforced silicone pipe, for temperatures up to 220°C, roll length 25 m.
PE-HD SPIRAL TUBING Ø 12 mm	HD polyethylene spiral tubing for resin flow under vacuum bag, roll length 50 m.
PE-HD SPIRAL TUBING Ø 20 mm	HD polyethylene spiral tubing for resin flow under vacuum bag, roll length 20 m.
Reinforced PVC pipe 12 x 19 mm	reinforced PVC pipe can be used both with resin and vacuum, for temperatures up to 80°C, roll length 100 m.
Flexible ramp DIADRAIN	flat resin distribution/vacuum channel, width 50 mm / 100 mm, roll length 100 m.
Flexible ramp DIADRAIN MP	flat resin distribution/vacuum channel with microporous film, width 50 mm, roll length 50 m.
Infusion valve for DIADRAIN MP	linking up with 10 x 12 mm pipe
SPIRALNET-OM70 12/14	spiral tubing 12 x 14 mm with OM70 resin channel for resin flow
Vacuum bag insert for infusion 12 mm	vacuum bag insert for spiral tubing 12 x 12 mm or SPIRALNET, for temperatures up to 90°C.
Connector L 10 mm	L-connector for pipes inside diameter 10 mm, for temperatures up to 90°C.
Connector I 10 mm	I-connector for pipes inside diameter 10 mm, for temperatures up to 90°C.
Connector T 10 mm	T-connector for pipes inside diameter 10 mm, for temperatures up to 90°C.
PA Connector T 10 mm	nylon T-connector for pipes inside diameter 10 mm, for temperatures up to 200°C.
Vacuum valve ACIV10PP	economic and useful valve with connectors, avoids the clamps, airtight with vacuum and resins, for pipes inside diameter 10 mm and temperatures up to 90°C.
Vacuum valve ACPRISE-VIDEUTO 1/4" M	automatic self cutting vacuum valve 1/4" M, for temperatures up to 210°C.
Vacuum plug ACPRISE-VIDE 1/4" M	vacuum plug 1/4" Male with direct linking up with 10 x 12 mm pipe.
Quick release coupling 1/4" - socket	quick coupling, socket
Quick release coupling 1/4" - plug	quick coupling, plug
AEROVAC Non Return Plug 1/4" BSP	quick coupling, plug
AEROVAC Non Return Socket 1/4" BSP	quick coupling, socket
INFUTAC AEROSOL 500 ml	infusion adhesive specially designed to hold reinforcing fibers in place, suitable for infusion, vacuum moulding or RTM. Available at clear or green colour.

## Infusion and vacuum moulding accessories & tubes

Item	Characteristics / Application
Adhesive spray 3T 410 ml	infusion adhesive specially designed to hold reinforcing fibers in place, suitable for infusion, vacuum moulding or RTM. Transparent.
Adhesive glass screen tape 50 mm	adhesive glass screen made to set fibers, bagging materials and the core materials during vacuum infusion process or vacuum moulding process. With 50 mm, thickness 400 µ, roll length 50 m.
Holding tank resin CO-XE-0500	multichannel catchpot, 3 inlets resin 12 mm, output gap 10 mm, for pipe 10/12 and temperatures up to 80°C.
Vacuometer 1/4" Male	vacuometer 1/4" M with glycerin, max. service temperature 60°C.
Vacuum pump PS 2V	oil-free vacuum pump, 47 - 55 l/min, -900 Mbar, 200W, 57 - 58 dB (A), 1465 - 1755 rpm, weight 7 kg.
Ultrasonic leak detector DETECT 05	hand leak detector incl. ultrasonic microphone, particularly adapter to the control of the flexible airtightness during the vacuum process.
Flash tape K0107	high temperature yellow tape for joining, masking or protection, max. temperature 180°C, width 25 mm, roll length 66 m.
Flash tape K7666	standard use blue tape for joining, masking or protection, max. temperature 180°C, width 13 mm / 25 mm / 50 mm, roll length 66 m.
Flash tape HT	standard use green tape for joining, masking or protection, max. temperature 180°C, width 25 mm, roll length 66 m.
Flash tape PTFE-2	high deformability grey tape for joining, masking or protection, max. temperature 260°C, width 25 mm / 4 mm / 51 mm, roll length 33 m.
Flash tape K7338	high temperature orange tape for joining, masking or protection, max. temperature 300°C, width 25 mm, roll length 33 m.
Flash tape K6337	high temperature orange tape for joining, masking or protection, max. temperature 300°C, width 25 mm / 50 mm / 100 mm, roll length 33 m.
Non-woven fabric ACR65	overlay non-woven fabric, 65 g/m <sup>2</sup> , for temperatures up to 200°C, roll length 100 m.
Thermoshrinkable fabric DIATEX 1500	thermoshrinkable fabric for compact nad hot drying of the laminate, 85 g/m <sup>2</sup> , PES, max. temperature 200°C, roll length 100 m.

PE-LD = low-density polyethylene, PE-HD = high-density polyethylene

Quick release couplings

## AUXILIARY MATERIALS, ACCESSORIES AND TOOLS

### Tooling

Item	Characteristics / Application
Insert 12 x 12 mm	nut for sealing split moulds, inner diameter 6,1 mm.
M6 union 12 x 12 mm	bush for sealing split moulds.
M6 Allen screw 6 x 30 mm	screw for sealing split moulds, screw length 30 mm.
Alignment dowels, Ø 8 mm	two-parts grooved dowels consist of brass bush and brass pin. Used for making GRP moulds.
Demoulding wedge 65 x 33 x 11 mm	demoulding wedge for demoulding components carefully and free of damage. Plastic, white colour.
Modelling brush 1" (25,4 mm)	extra short bristles, suitable for applying overlays and laminating resins.
Modelling brush 2" (50,8 mm)	extra short bristles, suitable for applying overlays and laminating resins.
Modelling brush 2,5" (63,4 mm)	extra short bristles, suitable for applying overlays and laminating resins.
Wax sheets 0.5 mm	calibrated wax sheets for use in mould construction, thickness 0,5 mm, surface area 0,18 m <sup>2</sup> (dimensions 305 x 610 mm).
Wax sheets 1.0 mm	calibrated wax sheets for use in mould construction, thickness 1 mm, surface area 0,18 m <sup>2</sup> (dimensions 305 x 610 mm).
Wax sheets 1.5 mm	calibrated wax sheets for use in mould construction, thickness 1,5 mm, surface area 0,18 m <sup>2</sup> (dimensions 305 x 610 mm).
Wax sheets 2.0 mm	calibrated wax sheets for use in mould construction, thickness 2 mm, surface area 0,18 m <sup>2</sup> (dimensions 305 x 610 mm).
Wax sheets 2.5 mm	calibrated wax sheets for use in mould construction, thickness 2,5 mm, surface area 0,18 m <sup>2</sup> (dimensions 305 x 610 mm).
Wax sheets 3.0 mm	calibrated wax sheets for use in mould construction, thickness 3 mm, surface area 0,18 m <sup>2</sup> (dimensions 305 x 610 mm).
Wax sheets 4.0 mm	calibrated wax sheets for use in mould construction, thickness 4 mm, surface area 0,18 m <sup>2</sup> (dimensions 305 x 610 mm).
Wax sheets 5.0 mm	calibrated wax sheets for use in mould construction, thickness 5 mm, surface area 0,18 m <sup>2</sup> (dimensions 305 x 610 mm).

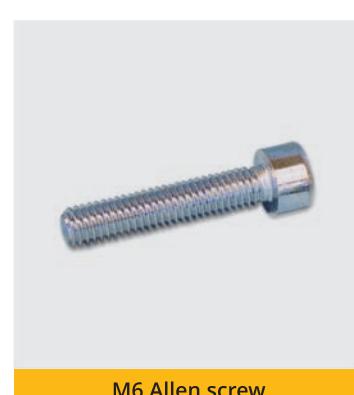

Insert 12 x 12 mm

Alignment dowels

M6 Allen screw

Demoulding wedge

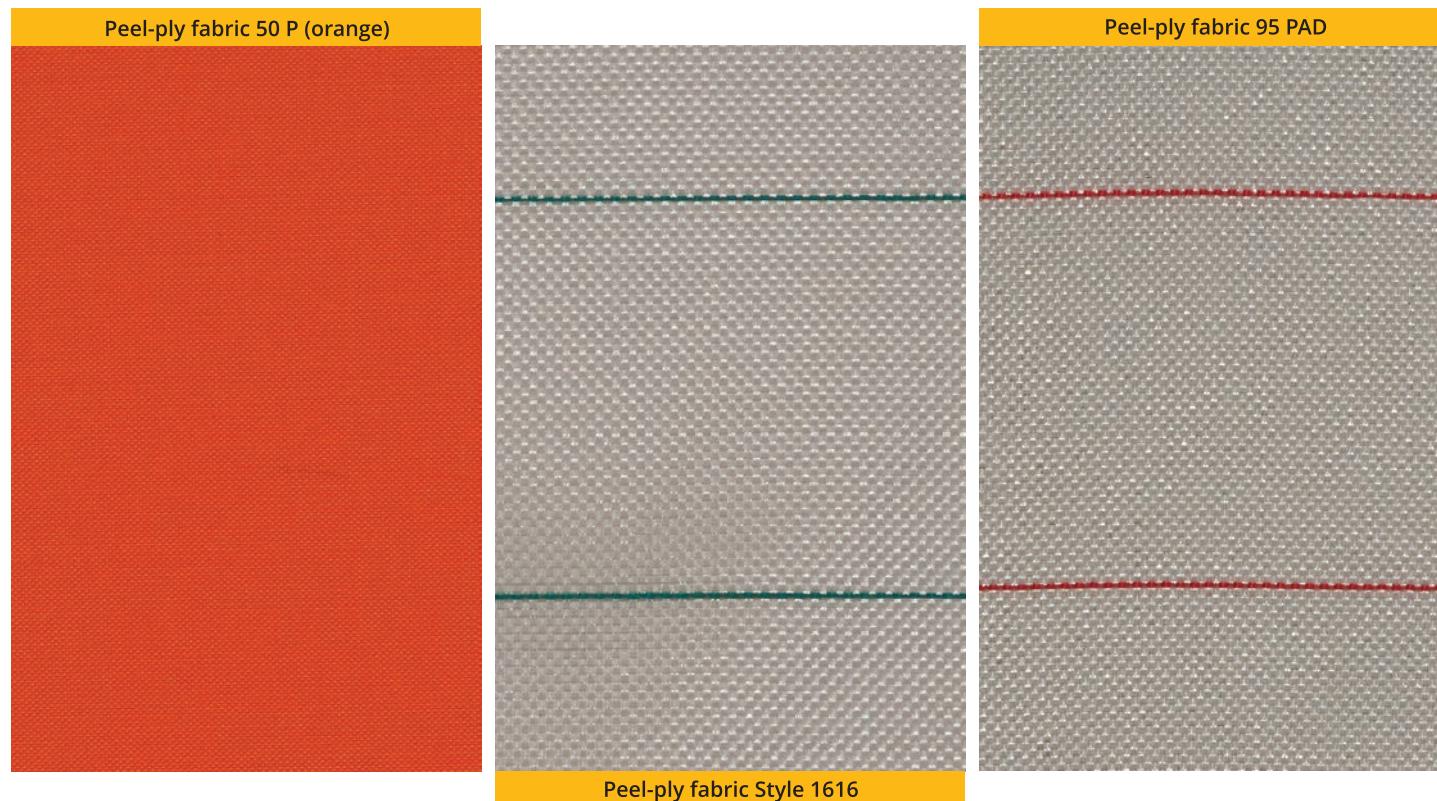

## Bleeders, breathers and multilayer systems

Item	Characteristics / Application
Net bleeder ISONET	115 g/m <sup>2</sup> , average speed, for temperatures up to 90°C, thickness 900 µ, blue colour, CO PE.
Net bleeder OM 70	180 g/m <sup>2</sup> , speed, for temperatures up to 90°C, thickness 1117 µ, black/green colour, PE.
Net bleeder DRAIKO	105 g/m <sup>2</sup> , high speed, for temperatures up to 90°C, thickness 1066 µ, black colour, PE.
Net bleeder DIANET 135	135 g/m <sup>2</sup> , high speed, for temperatures up to 90°C, thickness 1190 µ, green colour, CO PE.
Net bleeder FLONET	112 g/m <sup>2</sup> , very high speed, for temperatures up to 90°C, thickness 1100 µ, yellow colour, CO PE.
Net bleeder DIANET PA	125 g/m <sup>2</sup> , high speed, for temperatures up to 200°C, thickness 1050 µ, white colour, PA.
Breather fabric POLY-FLEX TF12	120 g/m <sup>2</sup> , 100% polyester, thickness 1,3 mm, width 100 cm, up to 180°C, white, roll length 100 m.
Breather fabric POLY-FLEX TF15	150 g/m <sup>2</sup> , 100% polyester, thickness 1,6 mm, width 100 cm, up to 130°C, white, roll length 100 m.
Breather fabric POLY-FLEX TF20	200 g/m <sup>2</sup> , 100% polyester, thickness 2,0 mm, width 100 cm, up to 130°C, white, roll length 100 m.
Breather fabric POLY-FLEX TF30	300 g/m <sup>2</sup> , 100% polyester, thickness 2,7 mm, width 100 cm, up to 130°C, white, roll length 50 m.
Multilayer infusion system INFUPLEX ISONET	combination of net bleeder ISONET + perforated film ELA20 P1 (average speed)
Multilayer infusion system INFUPLEX OM70	combination of net bleeder OM70 + perforated film ELA20 P1 (speed)
Multilayer infusion system INFUPLEX FLONET	combination of net bleeder FLONET + perforated film ELA20 P0 (very high speed)
Multilayer system VACUOPEEL® PA80 PES200 for vacuum moulding	combination of peel-ply fabric PA80 + bleeder PES200 + perforated film. Standard economic option.
Multilayer system VACUOPLEX® MP PA100ST PES150 for vacuum moulding	microporous multilayer system, combination of pink peel-ply fabric PA100ST + bleeder PES150 + perforated film. For prepreg applications

## AUXILIARY MATERIALS, ACCESSORIES AND TOOLS

### Peel-ply fabrics

Item	Weaving style	Width (cm)
Peel-ply fabric 50 P	50 g/m <sup>2</sup> , plain weave, orange / white / black	152
Peel-ply fabric 64 PAD	64 g/m <sup>2</sup> , plain weave, 100% polyamide, white with red stripes	100
Peel-ply fabric PA64	64 g/m <sup>2</sup> , plain weave, 100% polyamide, white with red stripes, up to 190°C, for thin surfaces	2 - 157
Peel-ply fabric Style 1616	78 g/m <sup>2</sup> , plain weave, 100% polyamide, white with green stripes	1,5 - 150
Peel-ply fabric PA80	80 g/m <sup>2</sup> , plain weave, 100% polyamide, white with red & blue stripes, up to 185°C, economic	2 - 156
Peel-ply fabric PA80AD	80 g/m <sup>2</sup> , plain weave, 100% polyamide, white with red & blue stripes, up to 185°C, economic + adhesive	2 - 156
Peel-ply fabric 85 PAD	85 g/m <sup>2</sup> , plain weave, 100% polyamide, white with red stripes	100
Peel-ply fabric PA90	90 g/m <sup>2</sup> , plain weave, 100% polyamide, pink with blue stripes, up to 185°C, for carbon	2 - 156
Peel-ply fabric PES90	90 g/m <sup>2</sup> , plain weave, 100% polyester, white with orange & green stripes, up to 210°C, phenolic	2 - 164
Peel-ply fabric 95 PAD	95 g/m <sup>2</sup> , plain weave, 100% polyamide, white with red stripes	1,5 - 150

## Laminating rollers

Item	Characteristics / Application
Paddle Roller (lengthwise grooved)	most popular and best value roller. Manufactured from aluminum extrusion, mounted on a galvanised wire frame with an ergonomic plastic handle. Easily cleaned in acetone. Available sizes: 50 x 21 mm; 100 x 21 mm.
Bubble Buster (lengthwise grooved, V-roller)	specialty aluminium roller combining the conventional paddle design with a "V" notch, to reduced the amount of spray. Available sizes: 50 x 21 mm; 100 x 21 mm.
Finned Roller (straight across grooved)	easy to use tool with reduced spray back. These tools are good for detail work and provide an efficient air removal as well as good consolidation. Light weight aluminium tools. Available sizes: 35 x 14 mm; 75 x 14 mm; 100 x 14 mm.
Steel Bolt Roller (straight across grooved, thread)	metal roller which provides very good air removal and a smooth finish. Ideal for difficult areas and detailed work. Easy to clean. Available sizes: 10 x 50 mm; 10 x 100 mm; 20 x 50 mm; 20 x 100 mm.
Disc Corner Roller D 150	aluminium roller used to press the fibres and resin into the corners of a mould to create definition. Diameter 4 mm.
Disc Corner Roller D 150P	plastic roller used to press the fibres and resin into the corners of a mould to create definition. Diameter 4 mm.
Plastic Finned Roller (straight across grooved)	plastic roller manufactured from Acetal, with excellent non stick properties, which makes it very easy to clean. This tool is non marking for when the finish is the top priority. Available sizes: 70 x 10 mm; 50 x 15 mm; 100 x 15 mm; 50 x 20 mm; 100 x 20 mm; 50 x 25 mm; 100 x 25 mm.
Bristle Brush	metal roller with pig bristle mounted on a spiral core. Suitable for puncturing air bubbles in polyester laminates with uneven surfaces. Available sizes: 22 x 50 mm; 22 x 100 mm.
Barrel Fin Roller (straight accross grooved, barrel-shaped)	aluminium roller which allows precise work whilst maintaining the efficiency of good air removal. Specially created for use on curved areas. Available sizes: 50 x 16/25/16 mm; 75 x 22/25/22, 70 x 10/12/10.
